PLAN

Capacity Diagram:

- ① Calculate vertical loads V_D (dead load), V_F (full load) and horizontal wind loads $H_W 100\%$ (full wind); $H_W 33\%$ (33% wind) on top of the tower.
- ② Plot characteristic points $V_D / H_W 100\%$ and $V_F / H_W 33\%$
- ③ The characteristic points shall remain below the line for the concerned tower.

Basic Data :

- ① **Material :**
Structural Steel according to IS 226 - 1975 (standard quality)
tensile strength $\sigma_u = 410 - 530 \text{ N/mm}^2$
yield stress $\sigma_f = 250 \text{ N/mm}^2$ for $\begin{cases} 6 \leq t \leq 20 \text{ mm} \\ 10 \leq \phi \leq 20 \text{ mm} \end{cases}$
 $\sigma_f = 240 \text{ N/mm}^2$ for $\begin{cases} 20 < t \leq 40 \text{ mm} \\ \phi > 20 \text{ mm} \end{cases}$
High tensile Friction Grip Bolts, Nuts, and Washers
according to IS 3757 - 1972; IS 6623 - 1972 and IS 6649 - 1972
- ② **Safety Factor :**
The towers have been designed without considering the effect of the side stay cables; the windload on the bridge shall be calculated without considering the effect of the windguy cables. Under this condition the safety factor has been fixed to 1.6
- ③ **Windload on Towers :**
Assumed uniform for all towers.
For full wind $\begin{cases} \text{dynamic pressure } q = 1.3 \text{ KN/m}^2 \\ \text{windload on tower } w_t = 1.02 \text{ KN/m} \end{cases}$
For partial wind $\begin{cases} \text{dynamic pressure } q = 50 \text{ kg/m}^2 \\ \text{windload on tower } w_t = 0.33 \text{ KN/m} \end{cases}$
